Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/506,419

Applicant(s)

RASMUSSEN, OLE-BENDT

Examiner

Brent T. O'Hern

Art Unit

1794

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 24 July 2009.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 123-151 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 123-151 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/CIS)
- 4) ☐ Interview Summary (PTO-413)
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____
- Paper No(s)/Mail Date _____

DETAILED ACTION

Claims

1. Claims 123-151 are pending with claims 149-151 new.

WITHDRAWN REJECTIONS

2. All rejections of record in the Office action mailed 4/24/2009 have been withdrawn due to Applicant's amendments in the Paper filed 7/24/2009.

NEW OBJECTIONS

Specification

3. The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). Correction of the following is required: the phrases "where the strands comprise coextruded thin lines" in claim 123, line 39, "where distances between adjacent arrays of strands measured from arrays center are the same or different and are between about 8cm and about 3 mm" in claim 149, lines 2-3, "where a distance between adjacent arrays of strands measured from arrays center are the same or different and are between about 8cm and about 3 mm" in claim 150, lines 2-4 and "where a distance between adjacent arrays of strands measured from arrays center are the same or different and are between about 8cm and about 3 mm" in claim 151, lines 2-4 are not supported by the text of the Specification. If Applicant believes support is present in the figures then Applicant is advised to amend the text of the Specification while being careful not to add new matter.

NEW REJECTIONS

4. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office Action.

Claim Rejections - 35 USC § 112

5. Claims 123-151 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

6. The phrase "where the strands comprise coextruded thin lines" in claim 123, line 39 is new matter. The terms strands and thin lines do not have the same meaning.

7. Claims 123-151 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

8. The term "thin" in claim 123, line 39 is a relative term which renders the claim indefinite. The term "thin" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. A person having ordinary skill in the art may interpret a line as being thin while another person having ordinary skill in the art could interpret the same line as not being thin.

Clarification and/or correction required.

Claim Rejections - 35 USC § 103

9. Claims 123-127, 129-130, 136-140, 143-144 and 147-148 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rasmussen (WO 01/96102) in view of Hendrickson (US 4,087,577), Wynne et al. (US 5,328,743) and Cederblad et al. (US 6,204,207).

The language regarding the strand limitations in independent claim 123 is broad with minimal specificity distinguishing the strands as reinforcing strands, non reinforcing strands, ribs, striations, streaks, etc. or whether the strands are flat, round, etc.. Analysis and evidence is lacking regarding any structural differences for a laminate with strands that are coextruded as opposed to strands that are embedded in a polymeric structure.

Rasmussen ('102) teaches a cross-laminate comprising a first coextruded film having a main direction of uniaxial unbalanced biaxial molecular orientation (*See p. 5, ll. 26-31 and FIG-2, cross laminate with multiple layers and sublayers.*)

FIG.2

The films A and B comprise heat seal layers #c, main layers #a and lamination layers #b, with individual compositions bonded to each other in the laminate as

illustrated in FIG-2 as well as bonding of the layers when the layers are wrapped such as in a gusseted tube. Since the layers have different compositions the bonding and adhesive strengths are different. Since some portions of the laminate are bonded at the seam there are regions of some of the laminate substrates that have additional bonding that is not present in other regions (See p. 2, ll. 42-58, p. 11, l. 25 to p. 12, l. 14, p. 5, ll. 26-31, p. 6, ll. 1-9 and FIG-2. *The Examiner interprets continuous to mean anything such as color, width, length, thickness, surface property, etc.. The claims do not set forth which side of film A is facing any particular side of film B, whether the main layers are the outermost or innermost surfaces of the laminate or just one is on an outermost surface. The claims do not require the strands from film A to be in "direct" contact with the strands in film B. Thus, the strands can be in indirect contact or embedded. The claims state the strands intersect each other, however, the strands are not interpreted as intersecting each other in a way that one would ordinary understand intersect to mean. The strands are interpreted as being in either the same or different planes from one another and not required to be in direct contact. Since the separation of the strands includes 0 cm, the strands do not need to be separated at all and a single polymeric layer of any dimension. Since, the strands do not need to be separated then there also does not have to be regions where there are not strands and thus no regions above and below the strands that are directly bonded to each other. There is no apparent difference in the structure between strands that are coextruded and those that are not.), however, fails to expressly disclose wherein the various layers are continuous, having a plurality of strands in films A and B, the bonding being different between the various*

layers and regions within the layer, a thickness increase of the films A and B at their respective strand locations being at most 20%/(10%) of a film thickness of the films A and B in adjacent regions of the films A and B devoid of their respective strands, the first and second polymer materials and comprising a polymer consisting essentially of a copolymer of ethylene having a melting point or a melting range within the temperature range of 50 - 100°C or a blend of such copolymer and LLDPE containing at least 25% of the copolymer and where the strands have a thickness of no more than 30% of a thickness of their respective films at their thickest, and where the strands comprise coextruded thin lines.

However, Rasmussen ('102) teaches where the structure is made into bags, wherein the layers are continuous when wrapped such as with a gusseted tube and as the layers progress to the opening(s) in the gusseted tube until the layers terminate. Each layer clearly has a pattern whether it is substantially the same, including wave-shaped web with stabilized waves (*See p. 8, ll. 28-32.*), within the layer or upon the bonded and non-bonded areas with various bonding strengths and the additional layers and or/markings will clearly be applied at various regions in a continuous manner to provide for the desired messages (*See p. 6, ll. 1-9.*). Pigments are added to the various compositions providing for further patterns (*See p. 11, l. 25 to p. 12, l. 14.*) for the purpose of providing a pleasing, strong bag for containing the packaged goods (*See p. 6, ll. 1-9.*).

Hendrickson ('577) teaches a polymeric bag reinforced with a two sets of crossing strands/ (thin lines) of a first polyolefin polymer that may be woven or

nonwoven into a grid while the polymeric sheets are made from a different polyolefin polymer, thus, providing for different bonding properties between the sets of strands, top and bottom sheets and between the strands and the sheets (See col. 3, l. 32 to col. 6, l. 35 and FIGs 2-6, with a bag as illustrated in FIG-5 and strands #16 illustrated in FIGs 2-3 and 6. The strands are clearly capable of being coextruded along with the film without there being any apparent structural difference between coextruded and non coextruded strands.)

and the thickness of the film and at the location of the strands being the same as at the location between the strands (See col. 4, l. 57 to col. 5, l. 1.) for the purpose of providing bags with improved strength and capable of accommodating larger payloads (See col. 6, ll. 36-61.).

Wynne ('743) teaches a polymeric material (See FIG-3, #40 and col. 5, ll. 5-59.)

with multiple polyolefin polymeric layers being reinforced with a grid of crossing strands
#54A and #54B and #30-32 made of different materials (See FIGs 4 and 2.)

FIG. 4

usable as a packaging material that can be seamed into bags (See col. 5, ll. 16-59.) for the purpose of providing a strong, reinforced protective material (See col. 5, ll. 44-59.).

Cederblad ('207) teaches a laminate with strands where the layers comprise a copolymer of ethylene having a melting point or a melting range within the temperature range of 50 - 100 °C (See col. 12, l. 42 wherein the melting point is 67 °C /152 °F.) for the purpose of forming firm bonds (See col. 6, l. 63.).

Therefore, it would have been obvious to a person having ordinary skill in the art at the time Applicant's invention was made to provide the above structure with a continuous and patterned structure as taught by Hendrickson ('577), Wynne ('743) and Cederblad ('207) and obviously taught by Rasmussen ('102) in Rasmussen ('102) in order to provide a strong material capable protecting and accommodating larger payloads.

The phrases "a separation between adjacent film A first strands is no more than 8 cm" in claim 123, lines 13-14 and 24-25 are not limiting since they include values of "0 cm" or no separation.

The phrase "where the strands have a thickness of no more than 30% of a thickness of their respective films at their thickest" in claim 123, lines 37-38 is not limiting since it includes values of zero.

The phrases "adapted to ***" in claim 124, line 3 and claim 143, line 2 do not limit the claims' scope since said language **does not limit the claim to a particular structure** (See MPEP 2111.04).

For the purposes of searching for and applying prior art under 35 U.S.C. 102 and 103, absent a clear indication in the specification or claims of what the basic and novel characteristics actually are, "**consisting essentially of**" will be construed as equivalent to "comprising". See, e.g., PPG, 156 F.3d at 1355, 48 USPQ2d at 1355 ("PPG could have defined the scope of the phrase consisting essentially of" for purposes of its patent by making clear in its specification what it regarded as constituting a material change in the basic and novel characteristics of the invention."). MPEP 2111.03 Also, If

an applicant contends that additional steps or materials in the prior art are excluded by the recitation of "consisting essentially of," applicant has the burden of showing that the introduction of additional steps or components would materially change the characteristics of applicant's invention. In *re De Lajarte*, 337 F.2d 870, 143 USPQ 256 (CCPA 1964). The "consists/ (consisting) essentially of" language is used in claim 141, line 2 and claim 142, line 6.

Regarding claims 138-140, Rasmussen (102), Hendrickson ('577) and Wynne ('743) teach the laminate discussed above, however, fail to expressly disclose wherein an average melting point of the third polymer material and average melting point of the sixth polymer materials are at least about 10°C/(15°C)/(20°C) lower than an average melting point of the first polymer material and an average melting point of the fourth polymer material.

However, Cederblad ('207) teaches a strand reinforced polymer structure where the average melting point of the polymer material of the layers of the films differ (*See col. 12, ll. 38-53.*) for the purpose of providing firm and light bonds (*See col. 6, ll. 60-67.*).

Therefore, it would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to provide strands with melting points below that of the films as taught by Cederblad ('207) in Rasmussen (102) in order to produce a laminate with firm and light bonds.

10. Claim 128, 131-135, 141 and 149-151 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rasmussen (WO 01/96102) in view of Hendrickson (US

4,087,577), Wynne et al. (US 5,328,743), Cederblad et al. (US 6,204,207) and Lappala (US 2,851,389).

Regarding claim 128, Rasmussen (102), Hendrickson ('577), Wynne ('743) and Cederblad ('207) teach the laminate discussed above, however, fail to expressly disclose where a collective area of the film A first strands and film B first strands comprises no more than 60% of a surface area of their respective film sides.

However, Lappala ('389) teaches a strand reinforced layered structure where any suitable diameter strand may be used (*See col. 2, l. 45, any suitable diameter can be used.*), which clearly changes the above area ratio. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of Applicant's invention to select a strand with a diameter that provides the above area ratio as taught by Lappala ('389) for the purpose of providing a laminate that is light and strong (*See col. 1, ll. 25-28.*).

Regarding claims 131-133 Rasmussen (102), Hendrickson ('577), Wynne ('743) and Cederblad ('207) teach the laminate discussed above, however, fail to expressly disclose wherein a volume of the film A strands and the film B strands is not greater than 15%/(10%)/(5%) of a volume of their respective films.

However, Lappala ('389) teaches that any suitable diameter strand may be used (*See col. 2, l. 45, any suitable diameter can be used.*), which clearly changes the volume. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of Applicant's invention to select a strand with a diameter that provides the

above volume as taught by Lappala ('389) for the purpose of providing a laminate that is light and strong (See *col. 1, ll. 25-28.*).

Regarding claims 134-135, Rasmussen (102), Hendrickson ('577), Wynne ('743) and Cederblad ('207) teach the laminate discussed above, however, fail to expressly disclose the separation between first strands on films A and B is between 2 mm and 40 mm/(at the highest 20 mm) measured from the middle of one strand to a middle of an adjacent strand.

However, Lappala ('389) teaches that any suitable pattern may be used (See *col. 2, l. 49-51, any suitable pattern.*) for the purpose of providing a laminate that is light and strong (See *col. 1, ll. 25-28.*).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of Applicant's invention to select a suitable pattern that provides the above separation as taught by Lappala ('389) in Rasmussen (102) in order to provide a laminate that is light and strong.

Regarding claim 141, Rasmussen (102), Hendrickson ('577), Wynne ('743) and Cederblad ('207) teach the laminate discussed above, however, fail to expressly disclose wherein the main layer of each of the two films A and B consists essentially of polyethylene or polypropylene.

However, Lappala ('389) teaches wherein the main layer of each of the two films A and B is polyethylene (See *col. 2, l. 31 and ll. 66-67.*) for the purpose of providing a laminate that is light and strong (See *col. 1, ll. 25-28.*).

Therefore, it would have been obvious to one having ordinary skill in the art at the time Applicant's invention was made to provide polyethylene layers as taught by Lappala ('389) in Rasmussen (102) in order to provide a laminate that is light and strong.

Regarding claims 149-151, Rasmussen (102), Hendrickson ('577), Wynne ('743) and Cederblad ('207) teach the laminate discussed above, however, fail to expressly disclose where distances between adjacent arrays of strands measured from arrays center are the same or different and are between about 8cm and about 3 mm, wherein the film A first strands, the film A second strands, the film B first strands and the film B second strands are arranged in arrays, where a distance between adjacent arrays of strands measured from arrays center are the same or different and are between about 8cm and about 3 mm, wherein the film A first strands, the film A third strands, the film B first strands and the film C first strands are arranged in arrays, where a distance between adjacent arrays of strands measured from arrays center are the same or different and are between about 8cm and about 3 mm.

However, Lappala ('389) teaches a strand reinforced layered structure where any suitable diameter strand may be used (*See col. 2, l. 45, any suitable diameter can be used.*), which clearly changes the above separation. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of Applicant's invention to select a strand having the above separation and orientation in view of Lappala ('389) for the purpose of providing a laminate that is light and strong (*See col. 1, ll. 25-28.*).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of Applicant's invention to select strands that provides the above separation and orientation as taught by Lappala ('389) in order to provide a laminate that is light and strong.

11. Claim 142 is rejected under 35 U.S.C. 103(a) as being unpatentable over Rasmussen (WO 01/96102) in view of Hendrickson (US 4,087,577), Wynne et al. (US 5,328,743), Cederblad et al. (US 6,204,207), Rasmussen (US 4,039,364) and Velazquez (US 5,614,297).

Rasmussen ('102), Hendrickson ('577) and Wynne ('743) teach the laminate discussed above, and Rasmussen ('364) teaches a laminate wherein the main layers are made from HDPE, LLDPE or a blend of the two (*See col. 13, ll. 3-7.*) and the strands in the first surface layers of the films is a polymer made from a copolymer of ethylene (*See col. 13, ll. 11-30.*), however, fail to expressly disclose wherein the bonding layers comprise LLDPE in admixture with 5 - 25% of a copolymer of ethylene having a melting point or a melting range within the temperature range of 50 - 80 °C.

However, Velazquez ('297) teaches a polyolefin stretch film having bonding layers comprising LLDPE in admixture with 5 - 25% of a copolymer of ethylene having a melting point or a melting range within the temperature range of 50 - 80 °C (*See col. 8, ll. 26-47 and col. 3, l. 46.*) for the purpose of providing a film that can be laminated with one or more films (*See col. 6, ll. 13-17.*).

Furthermore, Cederblad ('207) teaches wherein the layers comprising a copolymer of ethylene having a melting point or a melting range within the temperature

range of 50 - 80 °C (*See col. 12, l. 42 wherein the melting point is 67 °C /152 °F.*) for the purpose of forming firm bonds (*See col. 6, l. 63.*).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide a laminate with a surface layer of LLDPE and ethylene with the above melting point range and the above strands as taught by Velazquez ('297) and Cederblad ('207) in Rasmussen ('102) in order to provide a bondable laminate as described above.

12. Claim 145 is rejected under 35 U.S.C. 103(a) as being unpatentable over Rasmussen (WO 01/96102) in view of Hendrickson (US 4,087,577), Wynne et al. (US 5,328,743), Cederblad et al. (US 6,204,207) and Johnston (US 3,340,128).

Rasmussen (102), Hendrickson ('577), Wynne ('743) and Cederblad ('207) teach the laminate discussed above, however, fail to expressly disclose wherein the polymer material of the strands of at least one of the films A and B includes colored material that makes the colored strands visible through at least one side of the cross-laminate.

However, Johnston ('128) teaches a strand reinforced structure where the polymer material of the strands of at least one of the arrays comprises coloration material in sufficient amount to render the at least one colored layer visible through at least one side of the cross-laminate (*See col. 24, l. 58.*) for the purpose of providing a decorative motif (*See col. 24, ll. 59-60.*).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of Applicant's invention was made to provide strands with coloration as taught by

Johnston ('128) in Rasmussen (102) in order to provide a product having a decorative motif.

13. Claim 146 is rejected under 35 U.S.C. 103(a) as being unpatentable over Rasmussen (WO 01/96102) in view of Hendrickson (US 4,087,577), Wynne et al. (US 5,328,743), Cederblad et al. (US 6,204,207), Johnston (US 3,340,128) and Lappala (US 2,851,389).

Rasmussen (102), Hendrickson ('577), Cederblad ('207), Wynne ('743) and Johnston ('128) teach the laminate discussed above, however, fail to expressly disclose wherein the cross-laminate has a thickness at its thickest of about 0.3 mm, and wherein an exterior surface of the film A is corrugated to form a visible pattern of striations extending in one direction, where a spacing of the striations being at most about 3 mm: the main layer and the bonding layer of the film A are substantially transparent to enable the colored strands to be visible when the laminate is observed from one of the exterior surfaces of the cross-laminate, and a depth of the corrugations is sufficient to impart a three-dimensional effect to the cross-laminate such that the strands appear to be spaced internally from the exterior surface of the film A a distance substantially greater than an actual maximum thickness of the film A.

However, Lappala ('389) teaches a strand reinforced layered structure where the laminate thickness at its thickest is about 0.3 mm (*See col. 3, ll. 34-35 and col. 2, l. 45 wherein the films are less than 0.015 in (0.381 mm).*), the main layer and the bonding layer of the film A are substantially transparent to enable the colored strands to be visible when the laminate is observed from one of the exterior surfaces of the cross-

laminate (See FIG-3, #2.), where the spacing of the striations being at most about 3 mm (See FIG-3, *corrugations created by strands.*) the main layer and the bonding layer of the film A are substantially transparent to enable the colored strands to be visible when the laminate is observed from one of the exterior surfaces of the cross-laminate, and the depth of the corrugations being sufficient to impart a three-dimensional effect to the cross-laminate such that the strands appear to be spaced internally from the exterior surface of the film A a distance substantially greater than an actual maximum thickness of the film A (See col. 2, l. 7.), for the purpose of providing a laminate that is light and strong (See col. 1, ll. 25-28.).

FIG. 3

Therefore, it would have been obvious to a person of ordinary skill in the art the time of Applicant's invention to provide such a spacing and configuration as taught by Lappala ('389) in Rasmussen ('102) in order to provide a light and strong laminate.

ANSWERS TO APPLICANT'S ARGUMENTS

14. In response to Applicant's arguments (*See pp. 11-25 of Applicant's Paper filed 7/24/2009.*), it is noted that all arguments have been considered. Applicant has pasted most of the Office action mailed 4/24/2009 into Applicant's Paper filed 7/24/2009.

15. In response to Applicant's arguments (*See p. 12, under the heading "Preliminary Statement" of Applicant's Paper filed 7/24/2009.*) that its' strands, per the amended claims, are thin co-extruded lines, it is noted that these new limitations are discussed above. As discussed above, the Specification does not have support for these new limitations.

16. In response to applicant's argument (*See p. 12, last paragraph to p. 13 of Applicant's Paper filed 7/24/2009.*) that the examiner has combined an excessive number of references, reliance on a large number of references in a rejection does not, without more, weigh against the obviousness of the claimed invention. *See In re Gorman*, 933 F.2d 982, 18 USPQ2d 1885 (Fed. Cir. 1991).

17. In response to Applicant's arguments (*See p. 16, para. 2 to p. 17, para. 2 of Applicant's Paper filed 7/24/2009.*) that Rasmussen ('102) does not teach the bonding configuration between the films and the strands, it is noted that the Examiner does not disagree and this is why the secondary references are cited.

18. In response to Applicant's arguments (*See p. 17, para. 3 to p. 18 of Applicant's Paper filed 7/24/2009.*) that Hendrickson ('577) does not teach the strands as being coextruded but rather separate structures, it is noted that the Examiner does not disagree, however, as discussed above Rasmussen ('102) teaches the coextruded

structure (*See p. 5, ll. 26-31.*). Hendrickson ('577) is cited for teaching reinforcement strands for improving the strength of the structure (*See col. 6, ll. 36-61.*). Since Rasmussen's ('102) entire structure is coextruded it would have been obvious that the strands would also be coextruded along with the other films.

19. In response to Applicant's arguments (*See p. 18, paras. 3-4 of Applicant's Paper filed 7/24/2009.*) that Hendrickson ('577) and Wynne ('743) do not teach the strands with the claimed melting point, it is noted that these references are not cited for such. Cederblad ('207) is cited for teaching the melting point as discussed above in amended independent claim 123.

20. In response to Applicant's arguments (*See p. 20, para. 1 of Applicant's Paper filed 7/24/2009.*) that Lappala ('389) does not teach the strands as claimed and thus not the claimed bonding properties, it is noted that Lappala ('389) is not cited for the strand composition. Cederblad ('207) is cited for teaching strands/films with the above properties as discussed above in amended independent claim 123.

21. In response to Applicant's arguments (*See p. 20, para. 3 to p. 21, para. 2 of Applicant's Paper filed 7/24/2009.*) that since Cederblad ('207) does not teach its' strands being coextruded with the films it would not have been obvious to modify Rasmussen ('102), it is noted as discussed above that Rasmussen ('102) teaches the coextruded structure (*See p. 5, ll. 26-31.*). Cederblad ('207) is cited for teaching the composition of the strands/ layers (*See col. 12, ll. 38-53.*). Since Rasmussen's ('102) entire structure is coextruded it would have been obvious that the strands would also be coextruded along with the other films.

22. In response to Applicant's arguments (*See p. 21, para. 3 to p. 24 of Applicant's Paper filed 7/24/2009.*) regarding the various dependent claims and the bonding between the strands and the films, it is noted that the arguments are substantially the same if not the same as discussed above. The Examiner has fully reviewed and responded to Applicant's arguments.

23. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brent T. O'Hern whose telephone number is (571)272-0496. The examiner can normally be reached on Monday-Thursday, 9:00-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Sample can be reached on (571) 272-1376. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
